

ABSTRACT OF THE DISCLOSURE

A system and method ensures transparent synchronization of multiple applications across remote systems. In particular, the system has local application sharing logic to receive events to be shared from a local application and transmits the events to be shared to a remote application sharing logic. The remote application sharing logic receives events to be shared from the local application sharing logic and transmits the events to at least one corresponding remote application for processing. Transparent synchronization logic ensures transparent synchronization of the at least one local application with the at least one remote application. The present invention can also be viewed as providing a method for ensuring transparent synchronization of multiple applications across remote systems.
